4 Working Modes

Self-Consumption Mode

The power generated by the PV system will support the load and charge the battery. The excess electricity cannot be exported to the grid and the system won't draw the power from the grid.

Battery First Mode

The power required by the load will be obtained from the battery first. Only when the battery is exhausted will the system draw power from the grid to support the load.

Peak Load Shifting Mode

Battery charging and discharging time can be customized to reduce electricity bills. The battery can be charged from the grid at low grid price rates and discharged to supply loads when the power price is expensive.

Electricity Sales Mode

Customize the peak shaving and load shifting periods. During peak grid pricing, the system operates in grid priority mode to sell electricity. In off-peak times, it switches to energy storage priority mode, focusing on storing energy.
